This energy can be released as heat from a chain reaction in a radioactive element such as uranium. Nuclear Further investigation identified significant concentrations of fission products from both uranium and plutonium.) During this long reaction period about 5.4 tonnes of fission products as well as up to two tonnes of plutonium together with other transuranic elements were generated in the orebody. D.J. Bennet and J.R. Thomson, The Elements of Nuclear Power, 3rd Used nuclear fuel is a complex mixture of the fission products, uranium, plutonium, and the transplutonium metals. In fuel which has been used at high temperature in power reactors it is common for the fuel to be heterogeneous; often the fuel will contain nanoparticles of platinum group metals such as palladium.
